COMMENT
            on Jap 1, 1999 this adquence version replaced gi::666745.
            INFOSMALION: http://www.ngsc.om.tmc.odu/or email
            po-selpoporm.tmo.edu
            CLASS LEMGTH: This sequence does not necessarily represent the
            eaching disert of this of me. Overlapping regions of clones are only
            sequenced and submitted once, so the sequence for the remainder of
            the unsert may be found in the record for the adjacent clones.
            the sumpling climes are noted at the beginning and end of the
            Feature, disting.
            AID: TATION OF FEATURED:
```

CTSs are identified using GPCR (Ger.ome Res. 7:541-550) searches

of a local database that includes entries from dbSTS, GDB, and local mapping efforts.

Pepeats are identified using RepeatMasker (A. Smit and P. Green, unpublished.) for Human and Mouse sequences.

Cenes and Logicz of sequence similarity are identified by BLAST (Nuc. Acids Res. 21:3239-3402) similarity (expect < 1e-34) to the EST and CENA sequences. Genes demonstrate at least two exons flanked by consensus splice sites that maintained sequence continuity agrees the splice junctions. Sequences that are not identical matches are annotated as similar.

SECORNING READ COVERAGE: Sequencing is completed to a minimum standard of would strand obverage with a minimum of 2 clones and 2 reads with no antiquities or 2 chemistries with a minimum of 2 clones and 3 reads with no arkiquities. If the sequence quality for a region ober not meet this standard, it will be indicated in the adoptation as low Coverage.

QUALITY OF INDIVIDUAL BASES: This sequence meets stringent quality standards - estimated error rate less than 1 per 10,000 bases. Reports of lowest quality individual bases and measures of base quality are listed below. Rescription of the metrics can be found at UFD:

http://gc.tom.tmc.aou:8088/quality.info/genbank.annotation.html.
